WHITE PAPER

A private, on-chain reservation primitive

One trusted source of truth for *who reserved what* — without putting prices, terms, or personal data on-chain.

SECTION 1

What VRX is

VRX lets an operator with unique, non-substitutable inventory feed live availability to many mutually-distrusting sales teams, and let them browse, book, reserve, pay a deposit and hold — privately.

The one-liner

It is a callable **NEAR smart contract** (the reservation and hold registry) plus an off-chain **portal** (the apps each participant uses). Real estate is the beachhead and proof; the primitive is domain-agnostic — unit `312` is not unit `311`.

> **THE PRIVACY MOAT**
>
> No personal data, no prices, and no deal terms ever go on-chain. Every real-world identifier is stored as an opaque `SHA-256` hash. The chain proves *that* a reservation exists and *who* holds it; the *what / how-much / with-whom* stays off-chain.

Capability status

CAPABILITY	STATUS	SURFACE
On-chain reservation & hold registry	**built**	`contract/`
Private browse → book → deposit funnel	**built**	`portal/`
$VRX in-system credit ledger	**built**	`lib/vrx-token.ts`
On-rail settlement	**planned**	—

A sealed baseline (illustrative)

```
// a baseline seal — the ONLY content bytes on-chain, opaque + salted
fn attest(building_hash: String, seal_hash: String) {
  // no price, no name, no terms — just the proof it exists
  self.attestations.insert(&building_hash, &Attestation { seal_hash });
}
```

CONTRACT	`calculating-hand.testnet` (testnet)
SUPPLY	$VRX fixed at 200,000,000 — treasury-held, non-inflationary
PRIVACY	opaque hash / HMAC for every real-world identifier

SECTION 2

The reservation flow

The figure below is authored so its **first frame is the complete, labeled diagram** — exactly what prints. On screen, a reservation token travels the path and the held unit pulses; in a printed PDF the motion freezes at frame one, losing nothing.

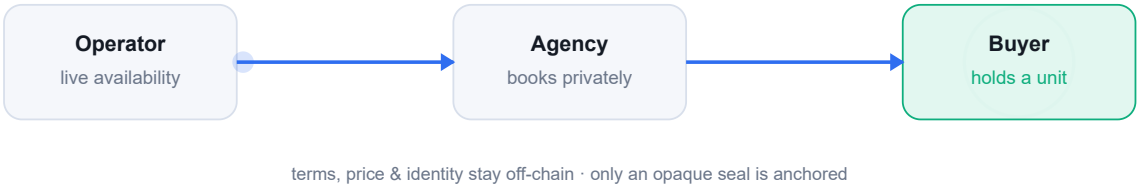

Figure 1 — Reservation flow. First frame prints as the full static diagram; on screen the token animates (SMIL).

ILLUSTRATION CONVENTION

Diagrams are inline SVG. Where motion aids comprehension we add **SMIL** (`<animateMotion>` / `<animate>`) as *enhancement only* — the `t=0` frame is always the complete, readable figure, so the printed PDF never loses information. Every figure carries `<title>` + `<desc>` for AI and screen-reader legibility.

This is a template proof, not content. It exists to verify A4 pagination, print fidelity, the brand system on paper, and the SMIL-with-static-first-frame illustration pattern before the whitepapers are authored into it.
